PNC Enterprise Engineer Sr - AI

Objective: earn trust by making one workflow legible, governed, testable, useful, and reusable - then return the learning to the broader engineering system.

Days 1-30 | Read the work and establish control boundaries

- Align with Amy, engineering peers, process owners, security, risk, data, quality, and platform actors on outcomes and decision rights.
- Select a representative workflow with visible friction, accessible owners, bounded risk, and measurable baseline.
- Map current process, exceptions, handoffs, data sources, approved context, user roles, and retained human authority.
- Inventory existing Copilot, prompt, agent, retrieval, and evaluation practices without imposing a new framework prematurely.
- Create an initial AI Work Control Envelope and baseline scorecard.

Days 31-60 | Build and prove one bounded workflow

- Separate orchestration, context/retrieval, prompt components, tools, policy controls, evaluation, and telemetry.
- Build a representative test set including common cases, edge cases, adversarial input, stale/conflicting context, refusal, and escalation.
- Constrain permissions and tool actions using least privilege and explicit allowlists.
- Run side-by-side human review and capture agreement, override reasons, missing context, and failure patterns.
- Define release posture: assist, controlled pilot, hold, or stop.

Prove value, transfer the pattern, and set the next portfolio decision

Days 61-90 | Release, observe, and return learning

- Release to a bounded user group with named owner, support path, rollback/fallback, and review cadence.
- Measure task success, groundedness, completeness, cycle time, rework, queue delay, adoption, overrides, escalations, incidents, and operating cost.
- Convert observed failure patterns into regression cases, prompt/context changes, process fixes, or clearer human checkpoints.
- Document the reusable pattern and what must remain workflow-specific.
- Present a portfolio recommendation: scale, adapt, repair, hold, or stop - with evidence.

Balanced scorecard

Dimension	Measures
Business outcome	Cycle time, queue delay, throughput, rework, completion
User experience	Task success, adoption, abandonment, clarity, trust
Quality and risk	Groundedness, completeness, exceptions, incidents, control failures
Human authority	Approval rate, overrides, escalations, disagreement reasons
Economics	Labor hours avoided, support burden, unit cost, maintenance
Learning speed	Regression growth, defect recurrence, change-to-proof time

Day-90 deliverables

- One production-ready or decisively stopped workflow with evidence.
- A reusable AI Work Control Envelope template and evaluation pack.
- A documented risk, authority, and escalation model.
- An operating dashboard and review cadence.
- A prioritized next-wave portfolio with scale/hold/stop rationale.
