Application letter for PNC Enterprise Engineer Sr - AI

Dear Amy Crisanti and Hiring Team,

PNC's opportunity is larger than writing better prompts. As enterprise AI platforms expand, the harder work is turning process knowledge into bounded, testable workflows that employees can trust and engineers can support. That is the work I have been doing at the intersection of operations, technical systems, human judgment, and measurable execution.

My current role at Vape-Jet places me directly inside a software-enabled robotics environment, connecting support, quality, production, engineering issue flow, Odoo, Jira, HubSpot, Slack, and telemetry into cleaner intake, prioritization, handoffs, standard work, and learning loops. Through DudeWorth, I develop AI-readiness and agentic workflow patterns that combine structured context, retrieval, tools, evaluation, escalation, decision records, and governance rails. Earlier work at Amazon and Compunetics built the operating discipline behind that approach: 24/7 mechanisms, high-reliability quality systems, cross-functional technical delivery, root cause, and visible accountability.

My candidate vision at <https://russelldudek.github.io/PNC/> makes the approach concrete through an AI Work Control Envelope. The model binds six conditions before an AI-assisted workflow earns scale: business intent, approved context, tool authority, evaluation evidence, human decision rights, and an operating record. It is an independent candidate-created mechanism, not a claim about PNC internal process.

I would bring a practical point of view: a production prompt is not merely an instruction. It is one component in a governed workflow with permissions, tools, tests, human authority, telemetry, and a measurable business outcome. I am comfortable working hands-on with process owners and engineering teams to make those boundaries explicit, test the workflow against representative and adversarial cases, and improve it from real operating evidence.

I would welcome the opportunity to discuss where PNC most needs reusable AI workflow patterns, how work currently progresses from process idea to engineering release, and what success should look like in the first 90 days.

Carpe diem,

Russell Dudek
