

Russell Dudek

Enterprise AI - 90-Day Entry Plan

OPERATING PREMISE

Discovery changed the plan. First establish a defensible way to triage AI demand across corporate functions, approved tools, vendor platforms, shared data, custom services, and strict control boundaries-then select the safest bounded proof.

EVIDENCE -> ADAPTATION

Multi-function demand. Create a corporate AI demand portfolio before proof selection.

Vendor-heavy estate. Map systems of record, integrations, source authority, data lineage, identity, access, and DLP before assuming an AI stack.

Approved starting points. Compare M365 Copilot, GitHub Copilot, vendor AI, deterministic automation, bounded custom, and hold/no-AI paths.

Emerging SWAT team. Make intake, decision rights, allocation, escalation, capacity, and reusable-pattern ownership explicit.

Risk shapes speed. Use offline, sandbox, shadow, draft-only, assist, or production-pilot evidence modes.

DAYS 1-30 - DISCOVER, PORTFOLIO & ALIGN

- Listen across the four confirmed corporate-function areas and control partners.
- Inventory demand, owners, systems, overlaps, failure modes, maturity, and baseline friction.
- Build stakeholder/decision-rights, system/lineage, governance, measurement, and economics maps.
- Select one or two proofs only when ownership, capability path, controlled data, human authority, evidence mode, and reversibility are explicit.

Russell Dudek

Enterprise AI - 90-Day Entry Plan

DAYS 31-60 - DESIGN, EVALUATE & PROVE

- Choose the simplest approved capability path.
- Apply the AI Work Control Envelope: business intent, approved context, tool authority, evaluation evidence, human decision rights, and operating record.
- Exercise normal, missing, conflicting, stale, permission, leakage, injection, tool-failure, fallback, and recovery cases.
- Operate only in the safest approved evidence posture and document advance, repair, hold, or stop.

DAYS 61-90 - LEARN, STANDARDIZE & RECOMMEND

- Repair model, source, lineage, process, permission, interface, training, vendor, or ownership defects revealed by evidence.
- Extract reusable intake, capability-selection, engineering, evaluation, governance, telemetry, and operating patterns.
- Publish SWAT-team cadence, ownership, production-readiness gaps, and the next-quarter roadmap.

BALANCED SCORECARD

- Business outcome: cycle time, queue delay, labor, rework, completed outcome.
- Quality and trust: groundedness, completeness, corrections, refusal, regression.
- Risk and authority: access events, sensitive data, overrides, escalation, rollback, recovery.
- Adoption: use, abandonment, repeat use, training, support, and review burden.
- Economics and complexity: licensing, inference, integration, monitoring, support, human review, vendor duplication, cost per accepted outcome.
- Reuse: shared components, regression coverage, adaptation burden, and operating ownership.

LIVE EXECUTION SYSTEM
