

STAKEHOLDER-INFORMED REVISION - AUGUST 3, 2026

OPERATING PREMISE

Understand the portfolio. Enter through one bounded workflow.
Earn the reusable pattern.

Discovery changed the plan.

The initial hypothesis centered on entering through one bounded workflow. The hiring conversation clarified a broader need: establish a defensible way to triage AI demand across corporate functions, approved tools, vendor platforms, shared data, custom services, and strict control boundaries - then select the safest proof workflow.

EVIDENCE -> ADAPTATION

Multi-function demand	Create a cross-functional AI demand portfolio before selecting a proof workflow.
Vendor and integration estate	Begin with systems of record, field authority, integrations, and data lineage - not an assumed AI stack.
Approved Microsoft/vendor tools	Choose existing capability, vendor AI, deterministic automation, bounded custom build, or no AI.
Emerging cross-director SWAT team	Make intake, ownership, allocation, review cadence, escalation, and reuse explicit.
Risk and DLP shape speed	Use the safest approved mode: offline, sandbox, shadow, draft-only, assist, or production pilot.

DAYS 1-15

Orient to the portfolio and decision system

- Listen across Enterprise Change, shared-services finance, supply chain/procurement, realty, engineering, architecture, data, security, risk, and adoption partners.
- Map SWAT-team intake, ownership, decision rights, escalation, capacity, and shared-versus-local responsibilities.
- Identify how ideas move from process pain to an approved delivery path.

DAYS 16-30

Build the demand portfolio and select a bounded proof

- Inventory requested and existing AI-assisted workflows, owners, systems, overlaps, failure modes, and maturity.
- Map systems of record, data lineage, identity, access, vendor capability, integration, observability, and DLP boundaries.
- Rank candidates by value, capability fit, feasibility, consequence, reversibility, economics, ownership, and change burden.

DISCOVERY OUTPUTS BY DAY 30

Corporate AI demand portfolio

Requests classified by function, owner, capability fit, systems, data, consequence, economics, capacity, and disposition.

Decision and SWAT-team map

Business intent, engineering, source authority, risk acceptance, approval, escalation, allocation, and reuse.

System and lineage map

Systems of record, integrations, field authority, transformations, access, vendor features, and conflicts.

Evaluation contract

Cases, expected behavior, failure classes, thresholds, reviewers, recovery, and regression ownership.

Measurement and economics baseline

Cycle time, labor, rework, exceptions, adoption, risk, total operating cost, and cost per accepted outcome.

DAY-30 DECISION

Select one or two bounded proof workflows only when accountable owners, approved capability paths, controlled data, representative users, evaluation evidence, human authority, and a reversible operating mode are explicit.

- DAYS 31-45: Design the bounded proof
- Choose the simplest approved path: M365 Copilot, GitHub Copilot, vendor feature, deterministic automation, or bounded custom service.
- Apply the AI Work Control Envelope: intent, context, authority, evaluation, human decision, and operating record.
- Define modular workflow, lineage, permissions, logging, review, fallback, stop, and recovery requirements.
- DAYS 46-60: Evaluate in the safest approved mode
- Exercise normal, missing, conflicting, stale, permission, leakage, injection, tool-failure, and recovery cases.
- Operate only at the approved posture: offline evaluation, sandbox, shadow, draft-only, assist mode, or production pilot.
- Observe completed outcomes, corrections, overrides, exceptions, review burden, trust, and hidden process defects.
- DAYS 61-75: Repair the operating mechanism
- Distinguish model or prompt defects from data, lineage, process, permission, interface, training, vendor, or ownership defects.
- Tighten controls, clarify authority and stop conditions, repair the workflow, and rerun the evaluation set.
- Confirm support, monitoring, incident, change, data-quality, and escalation responsibilities.
- DAYS 76-90: Standardize learning and recommend what advances
- Separate reusable intake, capability-selection, prompt, retrieval, tool, evaluation, telemetry, and governance patterns from local context.
- Publish the SWAT-team review mechanism, ownership record, operating cadence, pattern backlog, and next-quarter roadmap.
- Recommend advance, repair, hold, or stop using like-for-like evidence and PNC actual approval criteria.

90-DAY BALANCED SCORECARD

Dimension	Evidence	Decision supported
Business outcome	Cycle time, queue delay, labor, rework, completed outcome.	Did the workflow improve the work?
Quality and trust	Task success, groundedness, coverage, corrections, refusal.	Reliable enough for this use?
Risk and authority	Permission events, sensitive data, overrides, escalation, recovery.	Are boundaries working?
Adoption	Use, abandonment, acceptance, repeat use, training and review friction.	Becoming operating behavior?
Economics and complexity	License/inference, integration, monitoring, support, review, vendor duplication.	Better than existing capability or automation?
Reuse	Adaptation burden, shared components, regression, ownership.	What should compound?

ADVANCE	REPAIR	HOLD	STOP
---------	--------	------	------

Illustrative disposition bar only. The actual recommendation must follow PNC internal evidence, risk acceptance, capacity, and decision rights.

Discovery is not a prelude to the plan. Discovery changes the plan.

The revised plan demonstrates the operating behavior the role requires: listen, separate evidence from assumption, make the portfolio and constraints visible, choose the right intervention, prove it safely, and convert the learning into a reusable system.
